Application/Control Number: 09/992,094

Art Unit: 2631

Sourour discloses a sliding correlator comprising: storing a plurality of data samples (602) (the plurality of samples are stored in delay line 2m-2M-1); selectively processing the stored data samples by combining them with chip values (the stored samples are combined with code value by multiplying tap 608); and summing the result (the output from the multiplying is added by the adder 610 to produce despread signals). The processing further comprises selectively combining the stored data samples only for the delays of interest. (See fig.6 claims 1-24)

Bottomley discloses a method for dispreading a received signal comprising: storing a plurality of data samples (complex sample signals out from the RF receiver (1) are stored in sample buffer 2a, 2b, see col. 4, lines 21-29); selectively processing the stored data samples by combining them with chip values (the complex sample signals are processed by combining them with a known signature sequence (code) in complex correlator 4a, 4b, see col. 4, lines 42-48); and summing the result (the result are summed by the accumulator 6 to produce despread signal, see col.5, lines 1-4). The processing further comprises selectively combining the stored data samples only for the delays of interest. (See figs. 1 and 4. col.4, line 19 to col5, line 40 and col.11 line 7 to col. 12, line 31)
